Received 26 September 2001; accepted 8 July 2002

Abstract

Some occupational health and safety hazards associated with sheep shearing are related to shearing shed design. One aspect is the floor of the catching pen, from which sheep are caught and dragged to the shearing workstation. Floors can be constructed from various materials, and may be level or gently sloping. An experiment was conducted using eight experienced shearers as participants to measure the force exerted by a shearer when dragging a sheep. Results showed that significant changes in mean dragging force occurred with changes in both surface texture and slope. The mean dragging forces for different floor textures and slopes ranged from 359 N (36.6 kg) to 423 N (43.2 kg), and were close to the maximum acceptable limits for pulling forces for the most capable of males. The best floor tested was a floor sloped at 1:10 constructed of timber battens oriented parallel to the path of the drag, which resulted in a mean dragging force 63.6 N (15%) lower than the worst combination.

- 1 CATAPULTARUM rationes, e quibus membris ex portionibus componantur, dixi. Ballistarum autem rationes variae sunt et differentes unius effectus causa comparatae. Aliae enim vectibus suculis, nonnullae polyspastis, aliae ergastis, quaedam etiam tympanorum torquentur rationibus. Sed tamen nulla ballista perficitur nisi ad propositam magnitudinem ponderis saxi, quod id organum mittere debet. Igitur de ratione earum non est omnibus expeditum, nisi qui geometricis rationibus numeros et multiplicationes habent notas.
- 2 Nam quae¹ fiunt in capitibus foramina, per quorum spatia contenduntur capillo maxime muliebris vel nervo funes, magnitudine ponderis lapidis, quem debet ea ballista mittere, ex ratione gravitatis proportione sumuntur, quemadmodum catapultis de longitudinibus sagittarum. Itaque ut etiam qui geometricae² non noverunt, habeant³ expeditum, ne in periculo bellico cogitationibus detineantur, quae ipse faciundo certa cognovi quaeque ex parte accepta praeceptoribus, finita exponam, et quibus rebus Graecorum pensiones ad modulos habeant rationem,

¹ namq̄ H.

² geometricae e₂ (cf. nosse Graece Aug): -ce H.

³ habeant ed: habent H.

¹ mittere first means 'to let go.' The vernacular phrase *mitte*, 'chuck it,' is illuminating. Hence the solemn name of the mass, *missa*: 'the assemblage is dismissed, ite; *missa est*.'

² Euclid treats numbers geometrically, Books VII-X. It has been said of Newton that he could treat geometrically

1. I HAVE described the design of a catapult and the details which are combined in accordance with proportion. The design of the balista varies and its differences are adjusted for the purpose of a single effect. For some are worked by levers and windlasses, some by many pulleys, some by capstans, some by wheels. Yet all balistae are constructed with a view to the proposed amount of the weight of the stone which such a machine is to let fly.¹ Therefore only those craftsmen can deal with the design who are familiar with the geometrical² treatment of numbers and their multiples.

2. For the holes which are made in the frames (through the openings of which ropes are stretched, made especially of woman's hair or of the sinews of animals) are taken proportionately to the amount of the weight of the stone which the balista is to shoot, in accordance with gravity,³ just as in the case of catapults the *length of the arrows* furnishes the module. Therefore in order that persons who are ignorant of geometry may be equipped and may not be delayed by calculation amid the perils of war, I will specify in accordance with my own knowledge gained in practice and also in accordance with the instructions of my teachers. Further, I will set forth in detail the manner in which the Greek

problems which other mathematicians could only solve by analysis of a numerical character.

³ Specific gravity was discovered by Archimedes, Book IX., *pref.* 9 ff. The phrase 'centre of gravity,' κέντρον βαρύτος, was known before his time. Gow, *Greek Maths.* 238.

the details which are combined in accordance with proportion. The design of the ballista varies and its differences are adjusted for the purpose of a single effect. For some are worked by levers and windlasses, some by many pulleys, some by capstans, some by wheels. Yet all balistae are constructed with a view to the proposed amount of the weight of the stone which such a machine is to let fly.¹ Therefore only those craftsmen can deal with the design who are familiar with the geometrical² treatment of numbers and their multiples.

2. Therefore in order that persons who are ignorant of geometry may be equipped and may not be delayed by calculation amid the perils of war, I will specify in accordance with my own knowledge gained in practice and also in accordance with the instructions of my teachers. Further, I will set forth in detail the manner in which the Greek problems which other mathematicians could only solve by analysis of a numerical character.

Intermission:
a cautionary tale
which would shock
Stradivarius

...as we all know:

Energy is getting more
expensive....

Materials have to go further to
meet rising populations and
standards of living....

Labour is comparatively
cheaper

(or we're replaced by robots)....

....and designers,
engineers, scientists
from 20 countries

each find ways
to use materials better to design
out the embodied carbon
equivalent to driving
50 billion car miles

20 countries together could
save the carbon equivalent of
not driving
a Trillion Miles

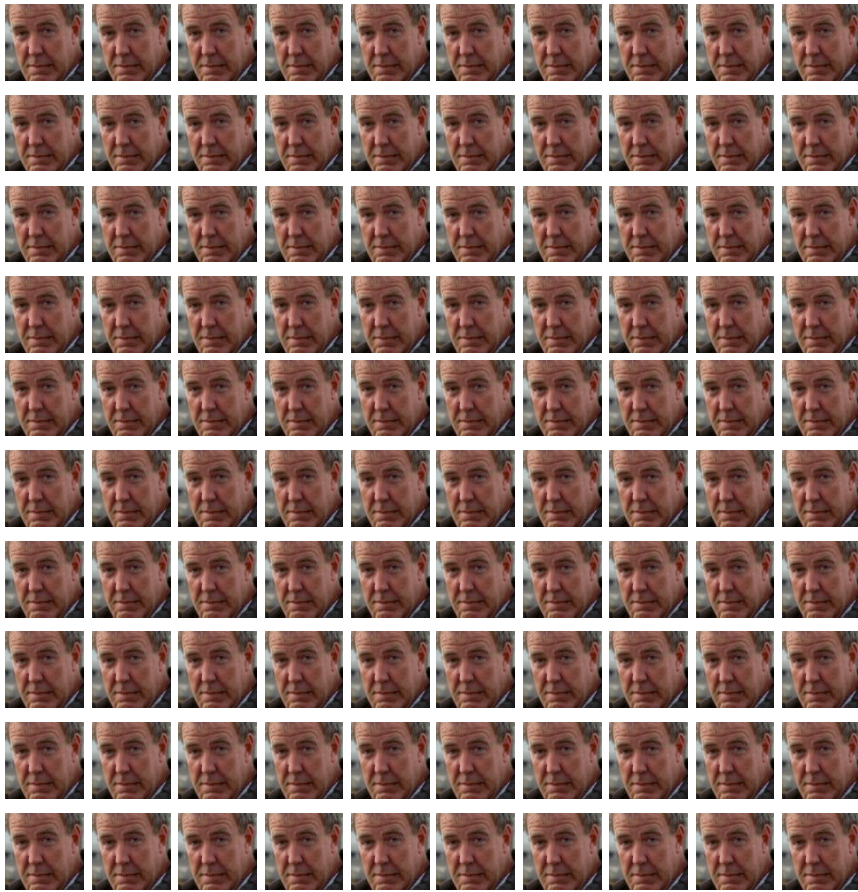

Suggested Units:

10 billion car miles = 1 Clarkson

100 Clarksons = 1 Trump

= 1 Trillion car miles

(a mind-bogglingly extravagant
quantity of energy)

100 Clarksons = 1 Trump

Saving a Trillion miles of
embodied carbon:

Wouldn't that be something

??

...but, a Trillion miles?

what can a humble
designer do?

as an example, take one
industry:

“Buildings”

where even a simple 9m office
beam like this weighs

735 kg

so here's a new one (which the industry won't make for us)

now only 513 kg

that's 30% lighter

Here's a 10 storey trad steel building

And here's its "perfect beam" equivalent

Here's the steel that is always wasted

A ridiculous global waste of, say,
30 million tonnes of steel
each year...

The carbon equivalent of not
driving

120 billion miles....

...enough energy to boil
700 cups of tea
for everyone on the
planet...

No matter how wonderful the
materials,
if designers and manufacturers
won't work together
to make them economically
viable.....

Inertia rules.....

And it has been scientifically
proven that it's always
someone else's
responsibility.....

Sydney Olympics 2000

car miles in the steel structure : **79 million**

8 years later: Beijing 2008

The image shows the Bird's Nest stadium in Beijing at night. The stadium's unique, woven steel structure is illuminated from within, creating a warm glow. The stadium is situated on a body of water, and its reflection is clearly visible in the calm surface. The sky is a deep blue, suggesting twilight. Large white numbers are overlaid on the center of the image.

725

million car miles

Carbon stickers for buildings??

with only the
back-of an envelope...

...we can save more and more

BROOKE BOND
PICTURE CARDS

Butterflies of the World

ILLUSTRATED AND DESCRIBED BY RICHARD WARD

PRICE SIXPENCE

A large, illuminated blue airship with a grid pattern of white lines, set against a dark background. The airship is the central focus, with its structure clearly visible. The lighting is bright, highlighting the texture of the material and the grid lines. The background is dark, making the airship stand out prominently.

We wondered if we could do it
...with the lightness of an airship

....airship plus the technology of
spiders

....and the craftiness of the Welsh

4 LAPS TO GO

The image shows the exterior of the Watercube building at night. The building's facade is composed of numerous translucent, blue-lit panels that resemble water molecules or bubbles. The panels are illuminated from within, creating a vibrant blue glow. The building is set against a dark night sky. In the foreground, several silhouetted figures of people are walking on a paved area. A signpost with a blank sign is visible in the middle ground. The overall scene is a striking contrast of light and shadow.
